## SePRO Ag announces that Brake® herbicide is now labeled for use in peanut

**Brake® Herbicide** Carmel, IN – Welcome news for peanut growers is that Brake® herbicide has received EPA approval for use in peanut. Brake® herbicide delivers broad-spectrum, long residual control of grass and broadleaf weeds, including herbicide resistant pigweed (palmer amaranth).

This benefit is due to Brake® herbicide's unique mode of action (Group 12), making the product an effective tank-mix partner to other commonly used herbicides to help create a strong IPM package.

"Southern cotton growers are well aware of the effectiveness of Brake® herbicide, and now this important weed control tool can help protect peanut crops as well," said Sean Lynch, SePRO Ag's Director.

"We have significant trial data in a variety of common peanut cultivars dating back to 2013," Lynch adds. "This fits with our philosophy of bringing unique tried-and-true weed control products to growers that offer true value, and not a 'me too' solution. SePRO Ag is true to our motto of *Upgrade Your Crop.*"
